### National Vascular Registry Report 2023: Summary for Anaesthetists

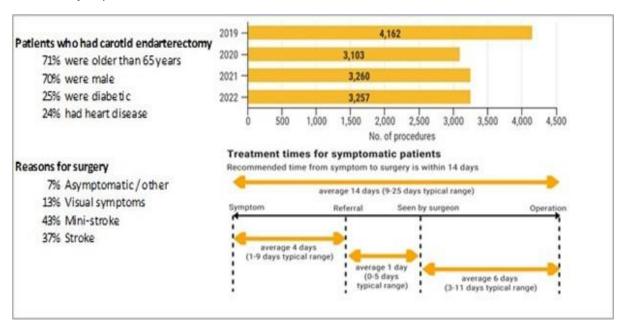

The NVR is commissioned by the Healthcare Quality Improvement Partnership (HQIP) as part of the National Clinical Audit and Patient Outcomes Programme and is designed to promote quality improvement within NHS hospitals performing vascular surgery by providing information on their performance.

In this summary we present data with direct relevance to vascular anaesthetists. The full report is available at 2023 NVR State of the Nation Report | VSQIP

#### **Carotid Endarterectomy**

In 2022, a total of 3,257 carotid endarterectomies were performed in the UK, compared to 3,171 in 2021. This number remains significantly reduced compared to 2019, when 4,162 procedures were performed.

A summary of patient characteristics is shown below.

# **Anaesthetic Type and Operative Details**

Operative details of unilateral carotid endarterectomies performed during 2022:

- 64.4% were performed under general anaesthesia (GA) alone
- 6.9% were performed under local anaesthetic (LA) alone
- 11.9% combined GA/LA or block was used
- 16.8% were performed under block or regional
- 64.9% of procedures involved the use of a shunt

Table 7.4 shows the operative details of unilateral carotid endarterectomies performed during 2022, 2021 and 2020.

Table 7.4: Operative details of carotid endarterectomies performed from 2020 to 2022

| Operation details         |                   | Procedures<br>(n=3,257) | 2022<br>% | 2021<br>% | 2020<br>% |
|---------------------------|-------------------|-------------------------|-----------|-----------|-----------|
| Anaesthetic               | General           | 2,097                   | 64.4      | 63.7      | 64.5      |
|                           | GA + block        | 387                     | 11.9      | 10.6      | 8.8       |
|                           | Block or regional | 547                     | 16.8      | 17.7      | 17.9      |
|                           | Local             | 226                     | 6.9       | 8.0       | 8.8       |
| Type of                   | Standard          | 240                     | 7.4       | 8.6       | 7.5       |
| endarterectomy            | Standard + patch  | 2,829                   | 86.9      | 86.6      | 87.5      |
|                           | Eversion          | 188                     | 5.8       | 4.8       | 5.0       |
| Carotid shunt used        |                   | 2,115                   | 64.9      | 64.0      | 61.8      |
| Ipsilateral patency check |                   | 2,233                   | 70.0      | 67.5      | 70.4      |

In 2022, the most common source of referral was the stroke physician (86.6%), vascular surgeons (2.8%), followed by neurologists (2.5%), and ophthalmologist (1.9%).

There were 3,083 patients (94.7%) with symptomatic disease.

- TIA was the most common symptom (45.0%), followed by stroke (39.1%).
- Over 70% of patients had at least 70% stenosis in their ipsilateral carotid artery at the time of operation.
- Only 0.7% of patients had a previous ipsilateral treatment

Medication for cardiovascular conditions was common among patients prior to surgery. Overall:

- 91.7% were on antiplatelet medication
  - o 51.8% on single and
  - 48.2% on dual therapy,
- 82.4% were taking statins

### **Treatment Pathways**

The median time from symptom onset to surgery for symptomatic patients in 2022 was 14 days (IQR 9-25 days). The median time delays were:

- 4 days (IQR 1-9) from symptom to first medical referral
- 1 day (IQR 0-5) from first medical referral to being seen by the vascular team, and
- 6 days (IQR 3-11) from being seen by the vascular team to undergoing CEA

There was considerable variation among NHS trusts in the median time to surgery during 2022:

- 36 of the 65 NHS organisations have a median time of 14 days or less
- The median exceeded 20 days for 8 vascular centres, which is an increase from 4 in 2021

27 trusts had less than half of their patients operated on within 14 days

### **Outcomes After Carotid Endarterectomy**

The complication rates for the 3,257 procedures performed in NHS hospitals in 2022 are summarised in Table 7.5. The rates of the different complications tended to be around 0.4-2.1% and have remained fairly consistent over the last few NVR Annual Reports.

#### Over this 12-month period:

- the median length of stay was 2 days (IQR: 1 to 4 days)
- the rate of return to theatre was 2.3% (95% CI 1.8 to 2.9), and
- the rate of readmission within 30 days was 4.5% (95% CI 3.8 to 5.2).

Table 7.5: Postoperative outcomes following carotid endarterectomy for 2022

| Procedures                            | 3,257                         |
|---------------------------------------|-------------------------------|
| Complication                          | Complication rate (%)<br>2022 |
| Death and/or stroke within 30 days    | 2.1 (1.6 – 2.6)               |
| Stroke within 30 days                 | 1.9 (1.4 – 2.4)               |
| Death within 30 days                  | 0.4 (0.2 – 0.7)               |
| Bleeding within admission             | 1.8 (1.4 – 2.4)               |
| Myocardial infarct within admission   | 1.1 (0.7 – 1.5)               |
| Cranial nerve injury within admission | 1.9 (1.4 – 2.4)               |

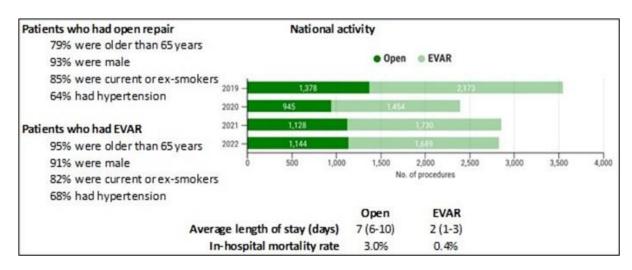

The NICE target time from symptom to operation is 14 days in order to minimise the chance of a high-risk patient developing a stroke. The median time from symptom to surgery for patients who had CEA in 2022 was 14 days and 52% were treated within 14 days. This is slightly worse than in 2021, when the median time was 13 days and 58% of patients were treated within 14 days. There is still variation in the waiting time for CEA between NHS organisations. The median time exceeded 20 days at eight NHS organisations, which is more than in 2021, although this is a half of the number of NHS organisations in 2016.

#### **Recommendations:**

- Ensure timely referral and expedited surgery for patients with symptomatic carotid disease with measures to reduce waiting times to carotid endarterectomy.
- The target time from symptom to operation is 14 days in order to minimise the chance of a high-risk patient developing a stroke.

#### **Elective Infra-renal AAA**

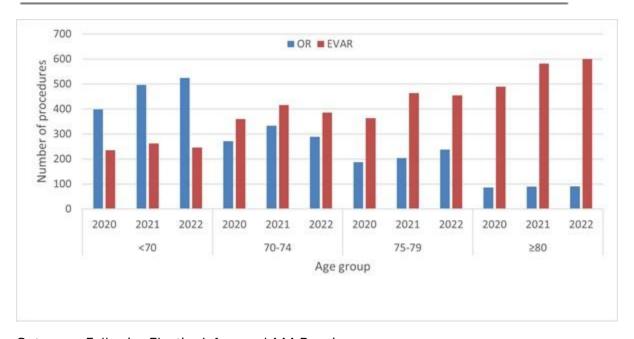

The organisation of vascular services undertaking AAA repair continues to evolve. The number of NHS vascular units performing any AAA repairs decreased from 72 in 2020 to 69 in 2022.

The NVR received information on 2,833 patients who had an elective repair of an infra-renal AAA in 2022. Overall, 60% of procedures were endovascular repair (EVAR) and 40% were open repair, but this split varied across NHS organisations.

Table 4.3: Split of open and endovascular elective infra-renal AAA procedures by year

| Year  | Open  | EVAR  | Total | % EVAR |
|-------|-------|-------|-------|--------|
| 2020  | 945   | 1,454 | 2,399 | 60.6   |
| 2021  | 1,128 | 1,730 | 2,858 | 60.5   |
| 2022  | 1,144 | 1,689 | 2,833 | 59.6   |
| Total | 3,217 | 4,873 | 8,090 | 60.2   |

Outcomes Following Elective Infra-renal AAA Repair

Table 4.6 describes various aspects of postoperative care for 2022.

• For EVAR, over 65% of patients went to a standard ward after surgery, and the median length of postoperative stay was 2 days.

• For patients undergoing open repair, over 95% of patients were admitted to a level 2 or level 3 critical care unit after surgery. Patients typically remained in critical care for 3 days and the median total postoperative stay was 7 days.

NHS vascular units achieved good outcomes after elective infra-renal AAA repair in 2022. The in-hospital postoperative mortality was 3.0% after open repair and 0.4% after EVAR. Rates of readmission within 30 days were 5.2% for open repair and 5.6% for EVAR. Between Jan 2020 to Dec 2022, the risk adjusted in-hospital mortality rates for all 67 NHS vascular units were within the expected range of the national average of 1.4%

The in-hospital mortality rate for open repair in 2022 was 3.0% (95% CI 2.1 to 4.1), comparable to 2.9% (95% CI 2.0 to 4.1) observed in 2021. The in-hospital mortality rate for EVAR was 0.4%.

Patients undergoing open repair were more susceptible to cardiac, renal and respiratory complications, and the rate of return to theatre was also higher.

For open repair, the rate of respiratory complications was 9.2% (95% CI 7.6 to 11.0) in 2022, a slight fall from 12.1% (95% CI 10.1 to 14.3) observed in 2020. For EVARs, respiratory complications decreased from 1.4% (95% CI 0.9 to 2.2) to 1.2% (95% CI 0.8 to 1.9) between 2020 and 2021. However, it increased to 1.4% (95% 0.9 to 2.0) in 2022.

Table 4.6: Postoperative details of elective infra-renal repairs undertaken in 2022

|                  |                      | Open repair |              | EVAR      |              |
|------------------|----------------------|-------------|--------------|-----------|--------------|
|                  |                      | (n=1,144)   |              | (n=1,689) |              |
|                  |                      |             |              |           |              |
| Admitted to      | Ward                 | 2.7%        |              | 68.0%     |              |
|                  | Level 2              | 60.8%       |              | 29.7%     |              |
|                  | Level 3              | 36.4%       |              | 2.2%      |              |
|                  | Died in theatre      | 0.2%        |              | 0.1%      |              |
|                  |                      | Median      | IQR          | Median    | IQR          |
| Days in critical | care: Level 2        | 3           | 2 to 4       | 1         | 0 to 1       |
|                  | Level 3              | 3           | 2 to 4       | 1         | 1 to 2       |
| Post-op length   | of stay (days)       | 7           | 6 to 10      | 2         | 1 to 3       |
|                  |                      | Rate        | 95% CI       | Rate      | 95% CI       |
| In-hospital post | toperative mortality | 3.0         | 2.1 to 4.1   | 0.4       | 0.2 to 0.9   |
| Defined compli   | cations              |             |              |           |              |
|                  | Cardiac              | 5.1         | 3.9 to 6.5   | 0.7       | 0.3 to 1.2   |
|                  | Respiratory          | 9.2         | 7.6 to 11.0  | 1.4       | 0.9 to 2.0   |
|                  | Haemorrhage          | 1.9         | 1.2 to 2.9   | 1.1       | 0.6 to 1.7   |
|                  | Limb ischaemia       | 3.0         | 2.1 to 4.1   | 0.2       | 0.0 to 0.5   |
|                  | Renal failure        | 4.9         | 3.7 to 6.3   | 0.5       | 0.2 to 0.9   |
|                  | Other                | 10.1        | 8.4 to 12.0  | 3.9       | 3.0 to 4.9   |
|                  | None of the above    | 70.3        | 67.6 to 73.0 | 92.4      | 91.0 to 93.6 |
| Return to theat  | tre                  | 7.3         | 5.8 to 8.9   | 1.2       | 0.8 to 1.9   |
| Readmission w    | ithin 30 days        | 5.2         | 4.0 to 6.7   | 5.6       | 4.5 to 6.8   |

The Vascular Society AAA Quality Improvement Framework (QIF) established several standards for preoperative assessment of patients undergoing AAA repair. In 2022, most patients treated in NHS vascular units received care consistent with the standard (see Table 4.5)

Table 4.5: Overall compliance with standards related to the VSGBI elective AAA care pathway

|   | Percentage of patients meeting standard |       |       |  |  |
|---|---|-------|-------|--|--|
|   | 2022                                    | 2021  | 2020  |  |  |
| Elective patients were discussed at MDT meetings  | 2,490/2,833<br>(87.9%)                  | 86.0% | 85.2% |  |  |
| Patients with an AAA diameter ≥5.5cm deemed suitable for repair had a preoperative CT/MR angiography assessment | 2,395/2,560<br>(93.6%)                  | 91.8% | 90.9% |  |  |
| Patients underwent a formal anaesthetic review  | 2,749/2,833<br>(97.0%)                  | 97.1% | 97.2% |  |  |
| Patients whose anaesthetic review was done by a consultant vascular anaesthetist                                | 2,529/2,748<br>(92.0%)                  | 92.2% | 92.1% |  |  |
| Patients who had their fitness measured   | 2,352/2,831<br>(83.1%)                  | 83.0% | 80.4% |  |  |
| Most common assessment methods:   |   |       |       |  |  |
| CPET  | 1,344/2,352<br>(57.1%)                  | 51.4% | 51.9% |  |  |
| Echocardiogram  | 1,086/2,352<br>(46.2%)                  | 46.2% | 42.2% |  |  |

# Anaesthetic Type

The table below demonstrates the anaesthetic types undertaken for elective infra-renal AAA repair in 2022.

| Туре   | Open  | EVAR  | Total | Open% | EVAR% |
|--|-------|-------|-------|-------|-------|
| GA Only  | 609   | 1,064 | 1,673 | 53%   | 63%   |
| LA only  | 0     | 128   | 128   | 0%    | 8%    |
| GA + LA  | 21    | 161   | 182   | 2%    | 10%   |
| LA + Plexus/Compartment                        | 0     | 8     | 8     | 0%    | 0%    |
| LA + Plexus/Compartment + Spinal/Epidural      | 0     | 1     | 1     | 0%    | 0%    |
| GA + LA + Plexus/Compartment + Spinal/Epidural | 1     | 0     | 1     | 0%    | 0%    |
| LA + Spinal/Epidural                           | 0     | 58    | 58    | 0%    | 3%    |
| GA + LA + Spinal/Epidural                      | 12    | 3     | 15    | 1%    | 0%    |
| Plexus/Compartment only                        | 1     | 10    | 11    | 0%    | 1%    |
| GA + Plexus/Compartment                        | 37    | 5     | 42    | 3%    | 0%    |
| Plexus/Compartment + Spinal/Epidural           | 1     | 0     | 1     | 0%    | 0%    |
| GA + Plexus/Compartment + Spinal/Epidural      | 3     | 0     | 3     | 0%    | 0%    |
| Spinal/Epidural only                           | 3     | 232   | 235   | 0%    | 14%   |
| GA + Spinal/Epidural                           |       | 18    | 473   | 40%   | 1%    |
| TOTALS   | 1,143 | 1,688 | 2,831 |       |       |

# **Other Elective Repair of Aortic Conditions**

Aneurysms can occur at various locations along the aorta. In addition to infra-renal aneurysms, a distinction is made between two other types:

- Juxta-renal (that occur near to the renal arteries)
- Supra-renal (that occur above the renal arteries), and

The two most common procedures are Fenestrated EVAR (FEVAR), performed when aneurysms are close to the renal arteries, and branched EVAR (BEVAR), performed when other arteries branching from the aorta are involved. For the period 2020-2022, 84% of the elective procedures were FEVARs and 13% were BEVARs.

In 2020-22, there were 1,266 endovascular procedures, which included 1,065 FEVAR and 161 BEVAR. There were 228 complex open repair procedures in 2020-2022.

| Other elective procedures |                        | Open | %    | Endovas<br>cular | %    | Total |
|---------------------------|------------------------|------|------|------------------|------|-------|
| Total procedure           | es                     | 228  |      | 1,266            |      | 1,494 |
| Age group                 | Under 66               | 63   | 27.6 | 118              | 9.4  | 181   |

Rates of postoperative mortality after complex endovascular repairs were lower than after complex open repairs. In 2020-22, in-hospital postoperative mortality rates were:

- 1.7% for endovascular procedures, being 1.6% for FEVAR, and for 1.2% BEVAR.
- 10.1% for open repairs.

Rates of readmission within 30 days were 5.0% for open procedures and 7.7% for endovascular procedures (see Table 5.2).

Table 5.2: Postoperative details of other elective repairs undertaken between January 2020 and December 2022

| Other elective procedures |                                     | Open repair<br>(n=228) |             | EVAR<br>(n=1,266) |            |

# **Repair of Thoracic Aortic Conditions**

Patients who suffer from a thoracic aortic aneurysm or aortic dissection are increasingly treated using a thoracic endovascular aortic repair (TEVAR). This procedure is performed in either a cardiothoracic unit or specialist vascular unit. Of the thoracic repairs, non-elective patients were younger and more likely to smoke. ASA fitness was higher for non-electives. Elective cases had more comorbidities.

In 2020-22, there were 405 emergency and 394 elective TEVAR procedures performed by 38 UK vascular units.

| TEVARS          |                        | Elective | %    | Non-<br>elective | %    | Total |
|-----------------|------------------------|----------|------|------------------|------|-------|

| In-hospital pos  | stoperative mortality | 2.0                 | 0.9 to 4.0  | 11.6                        | 8.7 to 15.1  |
| Return to thea   | atre                  | 3.8                 | 2.2 to 6.2  | 16.5                        | 13.0 to 20.5 |
| Readmission v    | vithin 30 days        | 8.5                 | 5.9 to 11.9 | 8.5                         | 5.8 to 11.9  |

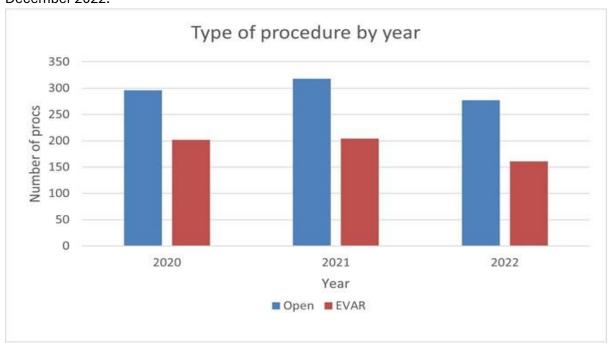

For elective cases, over 50% were admitted to level 2 care where they stayed for 2 days. Nearly half of non-electives procedures were admitted to level 3 care with a median length of stay of 4 days. Median postoperative length of stay was 4 days for elective TEVARs in the last three years compared with 9 days for non-elective patients. Non-elective mortality was six times more than elective cases. However, 30-day readmissions were similar for both admission modes.

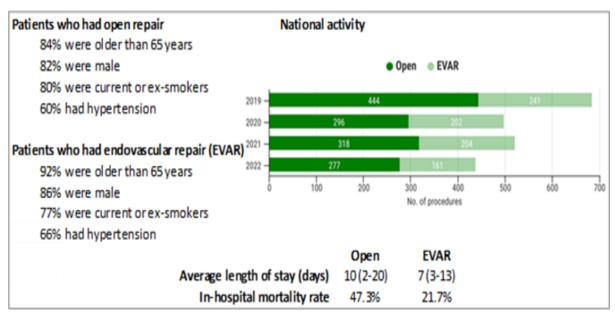

### **Ruptured AAA**

The NVR recorded 1,458 emergency repairs of a ruptured abdominal aneurysm between January 2020 and December 2022, with a slight fall from year to year. Estimated case ascertainment in 2020-2022 was 87%.

In 2018, around 30% of patients with ruptured AAA had an EVAR procedure. In 2022, this had increased to 37% of patients. Between 2020 and 2022, there were 13 units who performed more EVARs than open repairs for ruptured AAA.

Table 6.2: Number of open repairs and EVARs for ruptured AAAs between January 2020 and December 2022.

## Outcomes Following Ruptured AAA

The in-hospital postoperative mortality rates for EVAR and open repair were 21.7% and 47.3%, respectively, in 2020-2022. We caution against comparing the figures for EVAR and open repair because patients who have open procedures may represent the more complex cases that are unsuitable for endovascular repair. Rates of readmission within 30 days were 8.3% for open repair and 9.0% for EVAR. During the three-year period 2020-2022, all 61 NHS organisations had in-hospital postoperative mortality rates within the expected range after repair for ruptured AAA, given the number of procedures performed at the vascular units. The overall national average for this period was 37.3%.

For NHS organisations undertaking repair of a ruptured AAA between 1 January 2020 and 31 December 2022, the risk-adjusted postoperative mortality rates are shown in Figure 6.3. The inhospital postoperative mortality rates for the years 2020, 2021 and 2022 for open procedures were 50.3%, 45.0% and 46.6% respectively. For EVARs, the corresponding rates were 19.8%, 23.5% and 21.7%.

# Anaesthetic Type

The following table summarises the anaesthetic types for rAAA from 2020-2022.

| Туре                         | Open | EVAR  | Total | Open% | EVAR% |
|------------------------------|------|-------|-------|-------|-------|
| GA only                      | 285  | 765   | 1,050 | 93%   | 67%   |
| GA + Plexus/Compartment      | 2    | 1     | 3     | 1%    | 0%    |
| LA only                      | 1    | 284   | 285   | 0%    | 25%   |
| GA + LA                      | 3    | 69    | 72    | 1%    | 6%    |
| GA + LA + Plexus/Compartment | 1    | 1     | 2     | 0%    | 0%    |
| LA + Spinal/Epidural         | 0    | 5     | 5     | 0%    | 0%    |
| Spinal/Epidural only         | 1    | 13    | 14    | 0%    | 1%    |
| GA + Spinal/Epidural         | 13   | 11    | 24    | 4%    | 1%    |
| TOTALS                       | 306  | 1,149 | 1,455 |       |       |

#### **Recommendations:**

Vascular units should evaluate how access to endovascular repair can be improved for emergency repair of ruptured aneurysms. This may require:

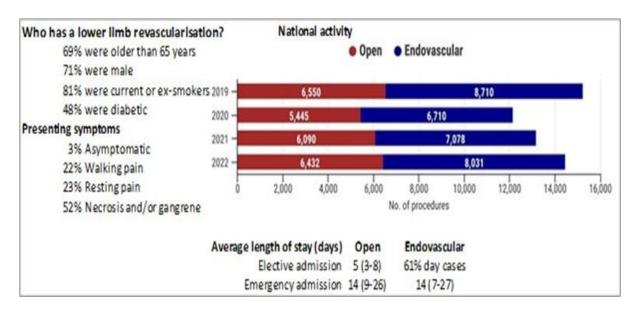

- Network pathways for vascular surgery working in collaboration with interventional radiology and vascular anaesthesia.
- 24/7 access to hybrid operating theatres.
- Developing teams with the required expertise qualified to deliver in and out of hours
  care including nursing staff and radiographers addressing workforce for both vascular
  surgery and interventional radiology.

### **Lower Limb Revascularisation**

In 2022, over 14,000 revascularisation procedures for chronic limb threatening ischemia (CLTI) (endovascular, hybrid and open bypass) were performed, compared to 13,065 in 2021. During 2022, there were:

- 6,432 bypass or open procedures (3,565 elective and 2,867 non-elective).
- 8,031 endovascular procedures (5,265 elective and 2,766 non-elective).

Estimated case ascertainment rates in 2022 were 89% for bypass and 54% for angioplasty. A summary of patient characteristics is shown below.

Most patients for open surgical procedures were over the age of 70 years presenting for elective and non-elective procedures, 34.6% and 35.4% respectively. Most had comorbidities, the commonest being hypertension (69.5% elective, 64.3% non-elective), followed by diabetes (35.6% elective, 43.9% non-elective) and then is chaemic heart disease (32.6% elective, 35% non-elective). A small proportion of patients had no comorbid disease (11.2% elective, 11.1% non-elective).

With regards to anti-platelet therapy, 84.9% of elective patients and 76.1% of non-elective patients were recorded as being on one anti-platelet agent, and 82.3% of elective patients and 75.2% of non-elective patients were recorded as being on a statin.

The following table summarises the patient characteristics for those undergoing lower limb revascularisation in 2022.

Table 2.3: Characteristics of patients undergoing lower limb revascularisation in 2022

|                         | Elective Non-elective |              |                |              |              |              |               |              |
|-------------------------|-----------------------|--------------|----------------|--------------|--------------|--------------|---------------|--------------|

Most endovascular procedures in 2022 (91.4%) were performed under local anaesthetic, with 1.7% under regional and 6.9% under general anaesthetic. For open procedures in 2022, 85.4% were performed under general anaesthetic, 12.1% under regional and 2.5% under local.

The following table (2.6) shows the characteristics of lower limb revascularisation procedures undertaken in 2022.

Table 2.6: Characteristics of lower limb revascularisation procedures undertaken in 2022

|                           | Elective      |               | Non-elective |               |
|---------------------------|---------------|---------------|--------------|---------------|
|                           | Endovascular  | Open          | Endovascular | Open          |
| Chronic limb ischaemia    |               |               |              |               |
| Asymptomatic              | 278 (5.3%)    | 31 (0.9%)     | 31 (1.1%)    | 18 (0.6%)     |
| Intermittent claudication | 1,781 (33.8%) | 927 (26%)     | 88 (3.2%)    | 43 (1.5%)     |
| Nocturnal/resting pain    | 942 (17.9%)   | 1,193 (33.5%) | 280 (10.1%)  | 516 (18%)     |
| Necrosis/gangrene         | 2,047 (38.9%) | 923 (25.9%)   | 2,128 (77%)  | 1,563 (54.5%) |
| Acute limb ischaemia      | 144 (2.7%)    | 150 (4.2%)    | 204 (7.4%)   | 584 (20.4%)   |
| Trauma                    | 8 (0.2%)      | 9 (0.3%)      | 13 (0.5%)    | 35 (1.2%)     |
| Aneurysm                  | 64 (1.2%)     | 331 (9.3%)    | 21 (0.8%)    | 108 (3.8%)    |

During 2022, there were 4,487 patients with chronic limb threatening ischaemia (CLTI) who were admitted non-electively. Of these, the median time (IQR) from admission to intervention was 5 (3-9) days.

The proportion of patients revascularised within 5 days was 51% in 2022. Among the 59 NHS organisations that performed 10 or more procedures for non-elective CLTI:

- 23 units had at least 50% of their patients wait more than 5 days
- 12 vascular units had at least 25% of their patients wait more than 10 days

There was an 8% increase in open surgical procedures for CLTI in 2022 (n=3,565) compared to 2021 (n=3,307), and of 23% in 2020 (n=2,889). There was a small increase in non-elective procedures, with 2,867 performed in 2022, compared to 2,873 in 2021 and 2,554 in 2020.

In 2022, 92.7% (n=5856) of open procedures (elective 97.7% and non-elective 86.4%) were performed between 8am and 6pm on a weekday. The percentage of open surgical procedures performed on planned lists was at least 75% for all but three NHS trusts that submitted 10 or more procedures in the NVR in 2022 (63 out of 666 NHS trusts, 95.5%).

The proportion of patients revascularized within 5 days from admission was 51% in 2022 (the PAD QIF standard). This is lower than in 2021 (54%) and 58.4% in 2020, but higher than in 2019 (47%). The timing to revascularisation for CLTI was:

Median wait from admission to intervention was 5 days (IQR 3-9 days) in 2022, 5 days
 (IQR:2-9 days) in 2021 compared to 4 days (IQR 2-8 days) in 2020

The overall length of stay for open procedures was 5 days (IQR 3-8) for elective procedures and 14 days (IQR 9-26) for non-elective procedures.

85% of elective cases and 71.6% of non- elective cases had no complications. However, those undergoing non-elective procedures had a generally higher complications rate and reintervention rates than those undergoing elective procedures, with limb ischaemia (8% non-elective, 2.5% elective), and respiratory (5.1% non-elective and 2.5% elective) complications being the highest.

The re-intervention rate (angioplasty/stent, bypass, minor and major amputation, 30-day amputation) was 7.5% for elective procedures and 28% for non-elective procedures.

The in-hospital postoperative mortality rate was 3.9% for elective patients and 4.8% for non-elective patients. The report highlighted that all NHS trusts had a risk adjusted in-hospital mortality following lower limb bypass that deck within the expected range of the overall national average of 1.9% (95% CI: 1.7 to 2.1) in this cycle

Table 2.7: Postoperative outcomes after lower limb revascularisation for 2022 by procedure type

|                                   | Elective      |               | Non-elective  |               |
|-----------------------------------|---------------|---------------|---------------|---------------|
|                                   | Endovascular  | Open          | Endovascular  | Open          |
| Total procedures                  | 5,265         | 3,565         | 2,766         | 2,867         |

### **Recommendations:**

• Patients admitted non-electively with chronic limb ischaemia should have a revascularisation procedure within 5 days.

- Improved data entry for this group especially for those who require a second unplanned procedure during the same admission.
- Trusts should aim to perform at least 75% of lower limb revascularisation on planned operating lists.

#### **Lower Limb Amputation**

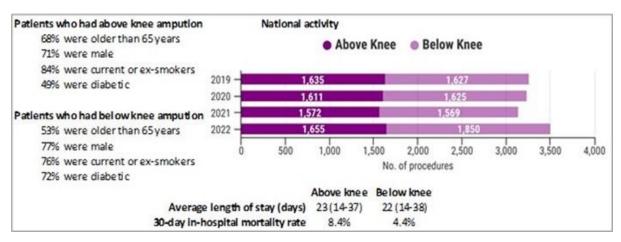

This chapter describes the patterns of care and outcomes for patients undergoing unilateral major lower limb amputations due to vascular disease during the audit period from January 2022 to December 2022.

During this period, 3,505 primary major unilateral amputations were recorded in the NVR, which consisted of 1,850 (52.8%) below the knee amputations (BKAs) and 1,655 (47.2%) above the knee amputations (AKAs). Through knee amputations (TKAs) have been analysed as part of the BKA group. TKAs accounted for 3.7% of all major amputations recorded on the NVR during the 1-year audit period. The case ascertainment rate was 88%, which exceeds the recommended 85% target by GIRFT vascular surgery report 2018.

In addition, NHS hospitals submitted information on 913 minor amputations, and other types of major amputation (58 bilateral, 30 due to trauma and 534 that were performed within 30 days of a lower limb revascularisation procedure). This chapter focuses on major unilateral lower limb amputations that were primary procedures, and these other types of procedure were not included in the analysis.

During the pandemic, there was a slight reduction in the number of unilateral major amputations undertaken within the NHS in 2020 and 2021, compared to 2019 (3,703 procedures). However, an increase of more than 300 major amputations were performed in 2022 than in 2019, which could be an indirect impact from COVID 19.

BKA's were more common in those under the age of 60 (31.7%), while AKA were more common in those over the age of 80 (19.4%). Most patients in both groups were mainly men, and were either current or ex-smokers.

Most patients had one or more comorbidities. The majority of patients requiring a BKA were diabetic (72.1%), compared to the majority being hypertensive (62.8%) in those requiring an AKA. It was common for patients to be on multiple medications, antiplatelet agents, statins,

antibiotic and DVT prophylaxis being the commonest. Oral anticoagulants were taken by 20-25% of patients.

Prophylactic antibiotics was recorded in 90.9% of BKAs and 89.7% of AKAs, and and DVT prophylaxis was recorded in 69.2% of BKAs and 68.6% of AKAs.

Table 3.3 shows the characteristics of patients undergoing lower limb amputation in 2022, and table 3.4 shows the pre-operative risk factors among patients undergoing lower limb amputation in 2022.

Table 3.3: Characteristics of patients undergoing major unilateral lower limb amputation in 2022

| Antibiotic prophylaxis               | 1,682 | 90.9 | 1,485 | 89.7 |
| DVT prophylaxis                      | 1,281 | 69.2 | 1,135 | 68.6 |
| Oral anticoagulant                   | 393   | 21.2 | 408   | 24.7 |

In 2022, there were 1,655 above knee and 1,850 below knee amputations, giving an overall AKA:BKA ratio of 0.89. Most NHS organisations had a ratio of less than one, but six organisations had a ratio above two.

# Overall, in 2022:

- 91% of major amputations occurred during daytime hours (8am-6pm)
- a consultant surgeon was present in 74% of the procedures

The median time from vascular assessment to amputation in 2022 was:

- 8 days (IQR: 3 to 20 days) for non-elective patients
- 37 days (IQR: 14 to 102 days) for elective patients, and
- 10 days (IQR: 3 to 29 days) for all patients

# Outcomes After Major Amputation

Patient outcomes immediately following a major lower limb amputation is summarised in table 3.6.

Overall, 27.8% of patients suffered one or more complication following major limb amputation; these were commonly respiratory (5.9% BKA, 9.6% AKA), cardiac (3.5% BKA, 5.6% AKA) complications and surgical site infections (4.9% BKA, 4.4% AKA), which were similar to the rates in 2021: respiratory (6.5% BKA, 8.9% AKA), cardiac (3.3% BKA, 4.4% AKA) complications and surgical site infections (4.8% BKA, 3.8% AKA). 8.8 % of BKA and 6.3% AKA had a return to theatre during their admission.

Most patients returned to the ward following an amputation, while 9.8% of BKA and 18=6.8% of AKA patients were admitted to critical care (level 2 or 3)

The overall median length of hospital stay for major lower limb amputation was 22 days (IQR: 14 to 38 days)

The overall rate of 30-day in-hospital death for major lower limb amputations in 2022 was 6.3%. As expected, it was higher for AKA (8.4%) than BKA (4.4%). Rates of readmission within 30 days were 9.5% for AKAs and 9.8% for BKAs.

Table 3.6: Patient outcomes following major lower limb amputations undertaken in 2022

|                                     | Below  |              | Above  |              |

|                                     | Median | IQR          | Median | IQR          |
| Days in level 2 critical care       | 2      | 1 to 4       | 3      | 1 to 5       |
| Days in level 3 critical care       | 3      | 2 to 6       | 5      | 2 to 8       |
| Overall length of stay (days)       | 22     | 14 to 38     | 23     | 14 to 37     |
| Postoperative length of stay (days) | 15     | 9 to 27      | 16     | 10 to 27     |
|                                     | Rate   | 95% CI       | Rate   | 95% CI       |
| Overall in-hospital mortality       | 5.9    | 4.8 to 7.0   | 10.0   | 8.6 to 11.6  |
| 30-day in-hospital mortality        | 4.4    | 3.5 to 5.5   | 8.4    | 7.1 to 9.9   |
| Procedure complications             |        |              |        |              |
| Respiratory                         | 5.9    | 4.9 to 7.1   | 9.6    | 8.2 to 11.1  |
| Cardiac                             | 3.5    | 2.7 to 4.4   | 5.6    | 4.6 to 6.8   |
| Limb ischaemia                      | 3.4    | 2.6 to 4.3   | 2.7    | 1.9 to 3.6   |
| Renal failure                       | 1.8    | 1.2 to 2.5   | 3.1    | 2.3 to 4.0   |
| Surgical site infection             | 4.9    | 4.0 to 6.0   | 4.4    | 3.4 to 5.4   |
| Postoperative confusion             | 2.5    | 1.8 to 3.3   | 2.4    | 1.7 to 3.3   |
| Haemorrhage                         | 0.2    | 0.1 to 0.5   | 0.5    | 0.2 to 1.0   |
| Cerebral                            | 0.4    | 0.2 to 0.8   | 0.5    | 0.2 to 1.0   |
| No defined complications            | 74.2   | 72.1 to 76.1 | 70.1   | 67.8 to 72.3 |
| Return to theatre                   | 8.8    | 7.5 to 10.1  | 6.3    | 5.2 to 7.6   |
| Re-admission to higher level care   | 2.3    | 1.7 to 3.1   | 2.4    | 1.7 to 3.2   |

# Anaesthetic Type

Anaesthetic data showed 49.11% of procedures were done under GA alone, 17% were combined GA with LA/RA and 34.4% were under LA/RA alone.

The following table summarises the anaesthetic types for major amputations undertaken in 2022.

| Туре                                      | N     | %     |
|---|-------|-------|
| GA only                                   | 1,726 | 49.1% |
| LA only                                   | 16    | 0.5%  |
| GA + LA                                   | 149   | 4.2%  |
| LA + Plexus/Compartment                   | 10    | 0.3%  |
| GA + LA + Plexus/Compartment              | 15    | 0.4%  |
| LA + Plexus/Compartment + Spinal/Epidural | 15    | 0.4%  |
| LA + Spinal/Epidural                      | 136   | 3.9%  |
| GA + LA + Spinal/Epidural                 | 7     | 0.2%  |
| Plexus/Compartment only                   | 70    | 2.0%  |
| GA + Plexus/Compartment                   | 287   | 8.2%  |
| Plexus/Compartment + Spinal/Epidural      | 160   | 4.6%  |
| GA + Plexus/Compartment + Spinal/Epidural | 3     | 0.1%  |
| Spinal/Epidural only                      | 782   | 22.3% |
| GA + Spinal/Epidural                      | 138   | 3.9%  |
| TOTALS                                    | 3,514 |       |

### **Recommendations:**

- All patients undergoing elective major lower limb amputation should be admitted in a timely fashion to a recognised arterial centre with agreed protocols and timeframes for transfer from spoke sites and non-vascular units.
- Below knee amputations should be undertaken whenever appropriate.
- Vascular units should aim to have an above knee amputation to below knee amputation ratio below one.
- Major amputations should be undertaken on a planned operating list during normal working hours.
- A consultant surgeon should operate or at least be present in the theatre to supervise a senior trainee (ST4 or above) undertaking the amputation.
- The patient should have routine antibiotic and DVT prophylaxis according to local policy.

## **Commentary**

This is the first National Vascular Registry State of the Nation report and aims to provide a summary of the care received by patients who had a major vascular procedure during 2022.

The report highlights several important aspects of vascular care within the UK.

Firstly, levels of activity continue to recover from the detrimental effect of the COVID-19 pandemic, with elective activity approaching the levels delivered in 2019. The excellent short-term outcomes after vascular procedures were also maintained. The times from vascular assessment to treatment have increased slightly for carotid endarterectomy and the elective repair of infra-renal AAA, although the picture is not uniform across the country.

A national focus for quality improvement over the last few years has been the 5-day target for revascularisation for emergency admissions with chronic limb threatening ischaemia (CLTI). Just over half of these patients underwent lower limb bypass or angioplasty within 5-days of admission in 2022, which is slightly down from the 55% achieved in 2021.

The rise in major lower limb amputations from 3,260 in 2019 to 3,430 in 2022 is of concern given the impact the loss of a limb has on patient well-being. It is unclear whether this is temporary or the start of a trend and requires further investigation to understand whether it reflects changes in the prevalence of disease or in clinical practice, including access to revascularisation.

The drop in the numbers of repairs for ruptured AAA is more encouraging. The postoperative mortality rate after open repair remains high, and there might be opportunities for greater use of endovascular repair. Its use is dependent upon patient stability and suitability but NICE [1] notes "EVAR provides more benefit than open surgical repair for most people, especially men over 70 and women of any age".

The next year will see an evolution in the collection of NVR data as the NVR data collection system becomes integrated with the NHS England system for collecting data on implanted medical devices.
